

Topic: Backgrounds: Images, gradients, sizing, positioning, and attachment.

Presenter: Vince Zyvon Florano

00:00 – 00:45 | Introduction

[Visual: Screen recording showing a plain HTML page transforming into a polished design with background imagery and gradients.]

Speaker:

"Hey everyone! Welcome back. In the next five minutes, you'll master the complete toolkit for CSS backgrounds: images, gradients, sizing, positioning, and attachment. By the end of this video, you'll know how to take a plain, boring container and turn it into a high-impact section for your website. Let's dive straight in."

00:45 – 01:45 | Concept Explanation

[Visual: Dynamic diagram or slides illustrating CSS background properties.]

Speaker:

"Before we code, let's break down the core properties you need to know:

background-image: Loads an image using `url()` or generates a smooth color transition using `linear-gradient()` or `radial-gradient()`.

background-size: Controls how the graphic fills its space. `cover` stretches the image to fill the container completely, while `contain` scales it so the entire image fits without clipping.

background-position: Sets where the graphic aligns—like center, top right, or precise percentages.

background-repeat: Prevents small images from tiling across your layout using `no-repeat`.

background-attachment: Determines if the image scrolls with the page (`scroll`) or stays frozen for a parallax effect (`fixed`)."

01:45 – 04:15 | Live Code Walkthrough

[Visual: Split-screen showing VS Code on the left and a live browser preview on the right.]

Speaker:

"Let's build a hero section. We'll start with a `.hero` container in our CSS.

First, we set our height and add a background image combined with an overlay gradient so our white text stays readable:

CSS

```
.hero {  
  min-height: 80vh;  
  background-image:
```

```
    linear-gradient(rgba(0, 0, 0, 0.5), rgba(0, 0, 0, 0.5)),
    url('hero-bg.jpg');
}
```

Notice how the image repeats and looks zoomed in? Let's fix that using the three standard alignment properties:

CSS

```
.hero {
  background-repeat: no-repeat;
  background-size: cover;
  background-position: center;
}
```

Now cover ensures no blank gaps exist, center keeps the focus of the photo middle-aligned, and no-repeat keeps it clean.

Finally, let's add that popular fixed parallax effect:

CSS

```
.hero {
  background-attachment: fixed;
}
```

Notice how as I scroll down the page, the content moves over the frozen background image.

Pro-tip: You can condense all of this into the shorthand background property:

CSS

```
.hero {
  background:
    linear-gradient(rgba(0,0,0,0.5), rgba(0,0,0,0.5)),
    url('hero-bg.jpg') center / cover no-repeat fixed;
}
```
```

---

## 04:15 – 05:00 | Summary and Conclusion

\*[Visual: Fullscreen webcam or final rendered website layout with overlay bullet points.]\*

\*Speaker:\*

"To wrap things up:

- \* Use **cover** and **center** as your go-to defaults for responsive background images.
- \* Combine **gradients with images** to guarantee contrast for text overlays.
- \* Use **background-attachment: fixed** when you want a quick, CSS-only parallax effect.
